

Reporting Tools

CGram Software™

Integrated Software for Business

Having one integrated system means you really get to know the whole of your business better. Reporting is more up to date, more consistent and more powerful than ever...

We know that Reporting is a big area for most companies, and our Enterprise software has been designed with exactly this in mind. How you get meaningful and up to date information out of your company system is key if you want to keep on top of your business operations and make good management decisions.

Reporting means different things to different people within your organisation and our approach reflects this. Different levels of system use by different types of people in your company need different styles of access - and reporting is no exception. Accounts and Finance have very different reporting needs to the Sales Team and the Production or Warehouse managers. So, instead of providing you with a single and potentially restrictive reporting tool to be used by all, we prefer to provide you with a system that lets you decide how best to extract and use the information you want.

Use our standard reporting tool. Our software is supplied with over 500 native reports and they provide you with much of what you'll need. The report formats are all editable and it's easy to tailor any report to your own needs using our own GUI report formatter (shown opposite). View data on-screen, send to file or simply print (via pdf).

Export or Query live data. Any data generated can be easily exported via a standard ODBC link into your preferred reporting tool, e.g. Crystal Reports. In addition you can also use Microsoft Query (with Visual Basic) to interrogate your company's data and view the results in Microsoft Excel. The CGram application handles the actual query and simply sends the search results directly to your Excel client - rather than downloading potential vast amounts of unnecessary data.

Produce reports from searches. The system also allows you to print directly from your normal searches. You can search your data for any number and combination of fields or criteria - and this is perhaps the most popular option for non specialist everyday users (i.e. those not involved in producing financial or statutory reports or documents).
